

Handoff and go-live

Reasoning lives in `GO-LIVE.md`. This is the sheet.

- Everything is in **123-reg**: domain, mailboxes, DNS.
- Never touch **MX**. Never change **nameservers**.
- `ns35/ns36.domaincontrol.com` is a GoDaddy hostname because GoDaddy owns 123-reg. It does not mean a GoDaddy account exists.
- You only have panel access while she's sitting there. Get delegate access before she logs out.

Tonight

- ☐ **Message her.** Sign into 123-reg → DNS management for `njhsporststherapy.co.uk` → can she see `@ A 185.230.63.107` and `www CNAME pointing.wixdns.net` ?
 - **Yes** → one login, no surprises tomorrow.
 - **"External nameservers", no zone** → a GoDaddy account exists after all; she needs that login before the meeting.
 - Confirming she can log in is the whole job. Don't ask her to change anything.
- ☐ Commit and push `site-content.js`, `style.css`, the three taping images. Confirm the deploy goes green.
- ☐ `noindex` the GitHub Pages copy, or retire the workflow.
- ☐ Bring: laptop, phone hotspot, the new Gmail password on paper.

1. DNS — 123-reg

Do this at minute five. Propagation takes ~2.5 hours.

- ☐ **Screenshot the whole zone.** This is the rollback.
- ☐ Edit both records in place. Don't delete and re-add.

Host	Type	From	To	TTL
@	A	185.230.63.107	75.2.60.5	8600 → 600
www	CNAME	pointing.wixdns.net	njh-therapy-2.netlify.app	3600 → 600

- ☐ Name field takes `@` and `www`, **not** the full domain. The panel appends it. This is the most common mistake.
- ☐ **Don't touch** MX, nameservers, or the wildcard `*`. Her mailboxes are in this same panel.
- ☐ Read both records back before moving on. A typo needs her to fix.
- ☐ **Before she logs out: ask for delegate access.** Domains → Manage All → delegate access. Otherwise every future DNS change needs another meeting. If she says no, agree she's reachable by phone for a week.

Zone was checked beforehand: one `A`, one `CNAME`, no `AAAA`, no `CAA`, no `DNSSEC`. Nothing hidden to clean up.

Then in Netlify:

- ☐ Domain management → **Verify DNS configuration**, once.

- ☐ **Expect it to fail all afternoon.** The old TTL is 8600. Normal. Don't keep pressing.
- ☐ Certificate and `www` primary are **evening jobs**. Say so out loud.

2. Gmail

Needs no login but the Gmail. Runs whatever happened above.

- ☐ Recovery **email** → hers
- ☐ Recovery **phone** → hers
- ☐ Password — **she types it**
- ☐ 2-Step Verification: if it's on your phone, move it or turn it off
- ☐ Security → Your devices → sign out yours
- ☐ Revoke app passwords and third-party app access
- ☐ Check filters and forwarding
- ☐ **She signs in on her own phone before you leave.** New accounts challenge on first unfamiliar device.
- ☐ Tell her Resend account emails will land here, and what they are.

3. Say out loud

- She owns the domain and the inbox. She is never locked in.
- Changes go through you — agree turnaround and cost. Format: which page, what it should say, photos attached.
- **Don't cancel Wix yet.** It's the rollback. Few months, then cancel. Export anything living inside Wix first: enquiry history, contacts, bookings, blog.
- Leave a one-pager: domain, email and DNS at 123-reg; site on your Netlify from the GitHub repo; mail via Resend; enquiries to the Gmail.

4. That evening — where this finishes

Allow 2–3 hours from the record change.

- ☐ Netlify → **Verify DNS configuration.** Should pass now.
- ☐ Wait for the certificate.
- ☐ Check the site on your phone **on mobile data**, not home wifi.
- ☐ Set `www` **as primary**.
- ☐ Send a real enquiry through the live form.
- ☐ Only now, tell her it's live.

Contingencies

123-reg won't manage DNS — "external nameservers"

A GoDaddy account exists after all. Do Gmail, the walkthrough, the sign-off. Leave DNS for whenever she finds that login. Nothing else depends on it. Re-delegating nameservers back to 123-reg is a last resort — it moves the whole zone and MX has to be rebuilt by hand. Not in the room.

Check the records actually saved

Bypasses every cache. Returns the new values the moment they're written.

```
dig @ns35.domaincontrol.com njhsportstherapy.co.uk A +short
```

```
dig @ns35.domaincontrol.com www.njhsportstherapy.co.uk CNAME +short
```

Expect `75.2.60.5` and `njh-therapy-2.netlify.app`. If you get them, the records are right and everything else is cache — including Netlify showing red.

Site doesn't appear

1. Check for the doubled domain: `www.njhsportstherapy.co.uk.njhsportstherapy.co.uk`
2. Run the two commands above

DNS verifies but the certificate fails

1. Wait 30 minutes. Netlify retries by itself
2. Press **Verify DNS configuration** once. If it fails, stop — repeated failures rate-limit you for an hour
3. Still failing: **remove the domain in Netlify, add it back**. Forces fresh provisioning, touches no DNS
4. Wait 30 minutes, press Verify once more
5. Still failing: leave it overnight, Netlify keeps retrying
6. Still failing next morning: Netlify support

Never switch nameservers to fix this. It works, and it takes her email down.

"Provisioning a certificate, you cannot change custom domains"

A failed attempt holding a UI lock. Harmless. Clears itself in 5–15 minutes.

Her email stops

```
dig +short MX njhsportstherapy.co.uk
```

Expect `mx0.123-reg.co.uk` (10) and `mx1.123-reg.co.uk` (20). If they're gone the nameservers were changed — put them back to `ns35 / ns36.domaincontrol.com`. This is what the zone screenshot is for.

Rollback the site

Needs panel access.

Host	Type	Value
@	A	185.230.63.107
www	CNAME	pointing.wixdns.net

The form stops working

It shouldn't — relative endpoint, no origin check, Resend reads neither record. If it does: Netlify → Functions → enquiry → logs. That's the only record an enquiry existed.

Her questions

"Will I lose my Google ranking?" No. `public/_redirects` maps every old Wix URL. Expect a wobble for a few weeks. Submit the sitemap in Search Console after.

"How do I change my prices?" Email you.

"Does cancelling Wix affect my email?" No. Mailboxes and domain are both at 123-reg. Wix is two lines of DNS.
